Y25 - 2026-2027 Trimester - 4

Project Abstract Submission Form

Sec No-1	Team No-14	Project Title - Personal Productivity Pattern Analyzer
----------	------------	--

1. Abstract:

Personal Productivity Pattern Analyzer is a machine learning-based system designed to analyse an individual's daily activities and understand the factors that influence their productivity. In today's routine, productivity can be affected by several factors such as study or work hours, sleep duration, screen time, break duration, exercise, tasks completed, and interruptions. Manually identifying relationships between these factors and productivity can be difficult. The proposed system collects these activity parameters and analyses them to identify meaningful productivity patterns.

The system will classify different productivity levels, identify common behavioural patterns among users, and determine which factors have the greatest influence on productivity. It will also identify unusual activity patterns and provide data-driven insights based on the user's daily activities. The system is intended to help users better understand their routines, recognize factors affecting their productivity, and make informed improvements to their daily habits.

2. Team Details

Roll Number(s)	Name of the Student
2520030008	Sagi Sahasra Srihasa
2520030011	Pamarthy Tejaswini

3. Frameworks / Platforms / Software Used

(List the frameworks, libraries, platforms, or tools you plan to use.)

Python – Programming language used for developing the machine learning system.
VS Code – Development environment for coding and testing the project
Pandas – Data loading, cleaning, preprocessing and analysis.
NumPy – Numerical computations and data operations.
Scikit-learn – Data preprocessing, machine learning models, clustering and model evaluation.
Matplotlib – Creating graphs and visualizations of productivity data.
Seaborn – Statistical data visualization and analysis.
Fast API – Developing an API to serve the trained machine learning model.
Git-hub – Hosting and collaborating on the project repository.
Git – Version control and tracking project changes.

Guide Name and Signature (remarks if any) _____
